

## **ABSTRACT OF THE DISCLOSURE**

A method and system for providing multiple medication products to a patient (for simultaneous ingestion or insertion into a live body by the patient) through a centralized medication product fulfillment facility, on an individualized, patient specific custom basis, in a cost effective, expedient manner which results in the maximization of medication intake compliance by the patient.

The invention encompasses a method and system for a treating physician or physicians to electronically transmit to a centralized medication product fulfillment facility prescriptions for multiple medication products for an individual patient, with each such prescription being received electronically at the centralized medication product fulfillment facility, and with the central medication product fulfillment facility then assembling and immediately distributing, generally directly as directed by the patient, the combination dosages of multiple medication products, which can be sourced from various points of origination, with each such combination dosage of said medication products, which has been customized on a patient-by-patient basis.
